

SMS

STORES MANAGEMENT SYSTEM ::

Spending Too Much Time Administering Client Charge Back?

Having Trouble Finding Transaction Records?

Need a Solution to Manage Inventory and Material Usage?

SMS - Stores Management System

A Cost-effective Solution for the Material Distribution Warehouse

SMS, a computerized and automated inventory system, is the ideal software for internal corporate stores where inventory management and account charge back are key concerns. Cost-effective, yet powerful and feature-rich, SMS effectively manages your inventory stock, keeps track of material or equipment issues and returns, and generates charge back to client accounts or business units.

Using state-of-the-art wireless and bar coding technologies, **SMS** optimizes the efficiency of your store's operation, enhances productivity and accuracy, automates transactions and provides instant access to any information you may need.

SMS Benefits

- Automate transactions and account charge back
- Instant and accurate information on material usage
- Increased inventory accuracy and employee productivity
- Cut costs through reducing unauthorized issues
- Less paperwork and lower clerical costs
- Rich, flexible and customizable features

Automated Transactions and Charge Back Generation

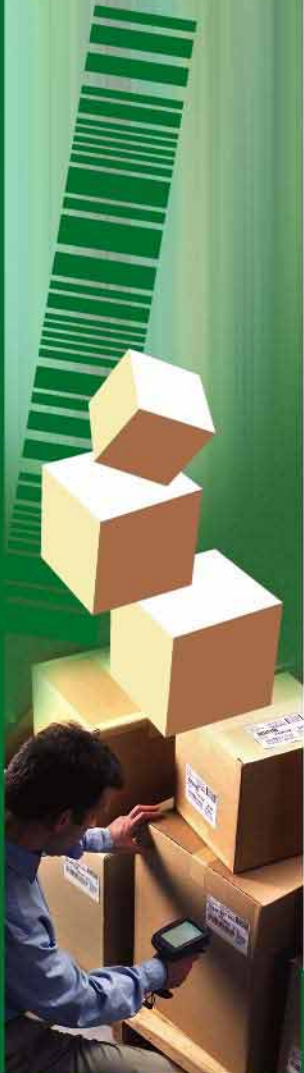

Using **SMS**, all transactions are associated with a business unit or a work order, allowing the system to automatically generate account charges or credits - no more additional paperwork and redundant manual data entry. **SMS** also provides information on material usage by business unit and individual.

Increased Efficiency and Cost Control

With the capability of online ordering, orders in **SMS** are handled more efficiently and accurately. For example, a stock keeper enters the order from a remote location using a handheld scanner, and the order is picked up by the central store before the delivery truck gets to the shipping dock. Also, because a business unit is mandatory for any issue, **SMS** cuts costs by eliminating unauthorized issues.

Improved Inventory Control and Accuracy

SMS greatly improves inventory control by automating transactions, tracking inventory status and monitoring stock on hand. By using bar code scanners to handle transactions, including physical counts, SMS greatly reduces data entry errors and saves time and effort.

SMS Features

Issues And Returns

- Associate all issues and returns with business units for client charge back or credit
- Make additional associations (with work order, requisition number, department or individual) to allow for in-depth reporting on material usage
- Track information on the condition of returned items (such as damaged or repair required)
- Manage kit items

PO and Receiving

- Instantly generate complete purchase history with information on vendors and pricing
- Receive full or partial shipments against Global Contracts or purchase orders

Inventory Management

- Set quantity minimums on each stock item for low inventory flagging
- Differentiate order unit versus issue unit to simplify orders and issues
- Conduct FIFO inventory valuation
- Use assorted pricing models for determining cost recovery
- Receive online requests and process orders for internal clients
- Conduct physical counts quickly and accurately using wireless bar code scanners
- Keep track of equipment scheduled for preventive maintenance or servicing

Flexibility and Custom Configuration

- Configure the program to use terminology specific to your organization
- Define custom-tailored access permissions for every user of the system
- Easily modify the application behavior to best suit your business process

Online Ordering

- Easy-to-use client software module with a browser-like interface
- Allow internal clients to request and purchase goods online
- Provide internal clients with online access to their accounts and purchase details
